SCI-FORGE 2026

A REAL-TIME UNIVERSE EXPLORER

Cosmos

The whole universe, to scale, explorable.

THE GOLDEN JOURNEY

Distance from Earth, each step ten times farther

The oldest light

45 billion light-years · the cosmic microwave background

The cosmic web

10^{25} m

6.5 billion light-years · 2.2 million real galaxies, placed by redshift

Virgo and Laniakea

54 million light-years · our home supercluster, 520 million ly across

Andromeda

2.5 million light-years · the nearest big galaxy

The Milky Way

10^{20} m

100,000 light-years across · 100 to 400 billion stars

Sagittarius A*

27,000 light-years · a black hole of 4.3 million Suns

TRAPPIST-1

41 light-years · seven Earth-sized planets

Proxima Centauri

10^{15} m

4.25 light-years · the nearest star

Then only dark: Voyager 1 would need 75,000 years to reach the nearest star.

Neptune

30 AU · more than 4 hours of light travel

The Sun and its planets

10^{10} m

150 million km · light takes 8 min 19 s; nearby, DART moved an asteroid

Space station and debris

400 km · 29,408 tracked objects in low orbit

Earth

10^{5} m

100 km up: the edge of space

Take the controls and fly from the space station to the oldest light in the universe, in one continuous move.

Every planet, moon, satellite, star and galaxy on the way is placed from real measurements: NASA, JPL, ESA Gaia and Planck, CelesTrak, DESI and many more.

Distances are true. Planets are drawn larger than life until you fly close, and the app says so on screen. Every image on this poster is a real-time render from Cosmos.
