SCI-FORGE 2026

A REAL-TIME UNIVERSE EXPLORER

Cosmos

The whole universe, to scale, explorable.

THE GOLDEN JOURNEY

Distance from Earth, each step ten times farther

The oldest light
45 billion light-years · the cosmic microwave background

The cosmic web
6.5 billion light-years · 2.2 million real galaxies, placed by redshift

10^{25} m

Virgo and Laniakea
54 million light-years · our home supercluster, 520 million ly across

Andromeda
2.5 million light-years · the nearest big galaxy

The Milky Way
100,000 light-years across · 100 to 400 billion stars

10^{20} m

Sagittarius A*
27,000 light-years · a black hole of 4.3 million Suns

TRAPPIST-1
41 light-years · seven Earth-sized planets

Proxima Centauri
4.25 light-years · the nearest star

10^{15} m

Then only dark: Voyager 1 would need 75,000 years to reach the nearest star.

Neptune
30 AU · more than 4 hours of light travel

The Sun and its planets
150 million km · light takes 8 min 19 s; nearby, DART moved an asteroid

10^{10} m

Space station and debris
400 km · 29,408 tracked objects in low orbit

Earth
100 km up: the edge of space

10^{5} m

Take the controls and fly from the space station to the oldest light in the universe, in one continuous move.

Every planet, moon, satellite, star and galaxy on the way is placed from real measurements: NASA, JPL, ESA Gaia and Planck, CelesTrak, DESI and many more.

Distances are true. Planets are drawn larger than life until you fly close, and the app says so on screen. Every image on this poster is a real-time render from Cosmos.
