Explore *it*

Cosmos starts at Earth. Drag to turn, scroll to travel, click anything to find out what it is. You cannot break it: press H to come home.

Every planet and moon is one click away. The strip at the bottom flies you to each planet; the row above it to each of its moons.

The golden journey, chapter 12 of 23: Proxima Centauri.

Press T and Cosmos flies you from Earth past the planets, the nearest stars and the black hole at the centre of the Milky Way to the oldest light in the universe, with a short story at every stop. About nine minutes.

Six things to try

1 Find the space station

Press / and type ISS. It is where it really is right now, with about 31,800 satellites and pieces of debris around it.

2 Visit every planet and moon

Keys 1 to 8 fly to Mercury through Neptune, 9 to Pluto. [and] step through the moons.

3 See the true scale

Click "Exhibition scale" at the top. In true scale the planets shrink to specks: space is mostly empty.

4 Look inside a planet

Open "Inside" on a planet's fact sheet for its layers, measured by quakes, gravity and spacecraft.

5 See the invisible sky

Open Light and switch the sky to radio, infrared, X-rays, gamma rays or the cosmic microwave background.

6 Speed up time

Press . to run time faster, up to 10 million times; Space pauses and N jumps back to now.

TOUCH

Drag	Turn around
Pinch	Zoom across scales
Two fingers	Pan
Tap	Select and read
Tap a label	Fly there

MOUSE

Drag	Turn around
Scroll	Zoom across scales
Right-drag	Pan
Click	Select and read
Double-click	Fly there

KEYBOARD

T	Start the tour	← →	Tour chapters
/	Search	B	Solar System navigator
0 – 9	Sun, planets, Pluto	[ ]	Moons
H	Home to Earth	Esc	Close
L O	Labels, orbits	?	All the keys

Four labs: change the numbers

Orbital debris

29,408 tracked objects crowd low orbit. Pick a launch policy and watch the next 100 years.

Asteroid deflection

Replay NASA's DART impact, then try to steer an asteroid away from Earth.

Habitability

Could a planet keep liquid water? Change its star and orbit, or explore 6,451 exoplanets.

Black hole

Drop a clock towards Sagittarius A* and watch time slow down.

Take it home

cosmos-astronexus.vercel.app

Runs in a web browser. No install, no account.
